HASHIMOTO'S CHEAT SHEET

Normal TSH but still exhausted? The signs, the six markers, and what to ask your provider.

From Episode 45 with **Melissa Bunkers, MSN, FNP-BC**, Revive Functional Medicine

WHAT IT CAN FEEL LIKE

Sleep doesn't fix it
8 to 10 hours of sleep and you still wake up exhausted.

The mid-afternoon crash
Body aches, heavy legs, and begging to lie down by afternoon.

Wired and tired at night
Your body needs rest, but you can't shut off.

Head to toe
Brain fog, gut issues, food sensitivities, even hives or rashes.

THE FULL THYROID PANEL: SIX MARKERS

MARKER	WHAT IT TELLS YOU
TSH	The standard screening test. A normal TSH does not rule out Hashimoto's.
Free T4	The storage form of thyroid hormone.
Free T3	The active hormone your cells actually use.
Reverse T3	The brakes. If it's high, it can block active T3 even when other levels look fine.
TPO antibodies	One of the two antibodies that show whether Hashimoto's is present.
TG antibodies	The second thyroid antibody. Ask for both.

TALK TO YOUR PROVIDER IF

- Symptoms, but you were told your thyroid is normal
- Only your TSH was checked
- Postpartum or perimenopause and depleted every day
- High dose iodine, selenium or vitamin D, no guide
